Characterization of a 34-kilodalton protein of Mycobacterium leprae
that is isologous to the immunodominant 34-kilodalton antigen of
Mycobacterium paratuberculosis
Infect. Immun. 66 (11), 5576-5579 (1998)

This is one of 2,122 random reads from the M13 library. For
annotation of identified clones (BLASTX, BLASTN and mapping to E.
coli K12 genome) please see ffrench-Constant et al. 2000, Nucleic
Acids Res.
Seq primer: M13 Forward
Class: shotgun.

The library was characterised by oligonucleotide fingerprinting
ONFP) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
battery of 200 Bmer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well the coordinates of the
rest of the clones assigned to the same fingerprint cluster as the
clone from which the above EST is generated is available at the
amphioxus project site at: http://www.noigen.maphioxus/
Clones and filters are distributed via the Resource Center/Primary
Database of the German Genome Project (http://www.rzpd.de)

Xhol; Morex (mla) plants were greenhouse grown in the R
Wise lab at lows State University, Ames, IA; 7 day old
green seedlings were infected with isolate 5874 of
Blumeria grammins f: sp. hordei, and leaves were harvested
24, 48 and 72 hr post-incoulation and snap frozen
(Wise).
In the TJ Close lab at the University of California,
Riverside, total RNA was prepared from each sample pool,
equal quantities of all three RNA pools were combined,
poly(A) RNA was purified from the mixture, one primary
unamplified cDNA library was made, and I million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids
(Chin). Phagemids were plated and picked at the Clemson
University denomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Whing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Whing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
above. For moore details on library preparation and

Cabernet Sauvignon. Clone B dissected buds. Samples were collected May 13, 2002 from pre-bloom plants (10-11 days before bloom), pre-veraison. Sampled vines were located at the University of California, Davis, Experimental Vineyard. cDNAs were made by oligo-dT priming and directionally cloned. 5' and 3' adaptors were used in
                                                                                                                                                                                                                                                                                                                                           CF512107 631 bp mRNA linear EST 09-SEP-2003 6Abud0004 IVR B10 Vitis vinifera cv. Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.

Claim 1; Fig 2; 39pp; English.

The invention relates to a recombinant nucleic acid molecule encoding efusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 kDa C-terminal fragment of serine protease antigen MTB32A of

```
Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another can be used in vivo as a DNA vaccine. This polynucleotide sequence and represents the DNA encoding the Ral2 protein

/*tag= a /product= "Ral2-mammaglobin fusion protein"

Location/Qualifiers

Chimeric.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 kbaic nolypeptide, comprising a polynucleotide sequence of Ral2, and a heterologous polynucleotide sequence.

Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies for use an antigen for monitoring binding of serum antibodies to fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses.

The coding sequences can be ligated with a coding sequence of another molecule such as a plax vaccine. This polynucleotide sequence can be used in vivo as a plax vaccine. This polynucleotide sequence can be used in vivo as a plax vaccine. This polynucleotide sequence of no 6-AUG-2003 to correct OS field.)                                                                                                                                                                                                                                                                                                                                                                                              This DNA sequence includes a coding region for a recombinant Mycobacterium tuberculosis bi-antigens Ra12 and DPD. The DNA is useful for the motigens Ra12 and DPD. The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in order to facilitate their fusion and subsequent expression of the fusion protein, and then ligated. The invention provides fusion proteins (see AAX32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polynucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Mycbacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cutantyport and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of sexum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents DNA encoding an M. tuberculosis tuberculosis. This is equence represents DNA encoding an M. tuberculosis fusion protein of the invention. This polynucleotide encodes 3 different proteins, each in a different reading frame. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                                                                                                                                                                                                                                               ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium spy, and a Leishmania polynucleotide sequence encoding a polypucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis RajsFlMutSA mutant antigenic protein encoding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, or 6H polynucleotide, useful as vaccine to elicit protective immunity inst pathogenic microorganisms e.g. Leishmania and Mycobacterium

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polynuclectide sequence encoding an antigen or an antigenic fragment from Mycobaccerium sp. and a Leishmania polynuclectide sequence encoding a Delypeptide or ite fragment. The Leishmania polynuclectide is selected from TSA, LeIF, MIS, and 6H polynuclectides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as a vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobaccerium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynuclectides, as an in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mituberculosis mature Rais (N-terminus of MTB12A, RAISFE) antigen encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      657
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Arcedeceracedecriceresecrises are areas and a second secon

```
The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprositions comprositions antigens, nucleotides encoding them and particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serlogical sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammai, e.g., human, immunised with BCG. They are useful in the diagnosis, treatment and prevention of Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or call-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as the munogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is a CDNA encoding Mycobacterium species MTB32E) mature protein
                                                                                                                                                                                                                                                                                                                                                                                                             Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1002 BP; 169 A; 331 C; 342 G; 160 T; 0 U; 0 Other;

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the exclosical sensitivity of sera from individuals infected with cuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention and insuling an immune response in a mammal, e.g., human, cuseful for eliciting an immune response in a mammal, e.g., human, mannish of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium infection. The fusion proteins and the population of Mycobacterium infection or monitoring of disease progression, as antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for rasing anti-M. tuberculosis antibodies in a non-human continual sequences of the invention are also used as avecines. Mrsalla sain proteins of the invention are also used as avecines of the invention are also used as a confice of fusion proteins of the invention are useful as in vivo diagnostic agents of the invention are useful as in vivo diagnostic agents of the intradermal skin test. The present sequence is a cDNA encoding Mycobacterium species RajzFL mature protein mutant, RajzFlMutSA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition comprising MTB39 antigen and MTB32A antigen from
Mycobacterium species, useful for eliciting immune response in a subject.
